FMW Web

Financial Manager's
Workbench - Web edition
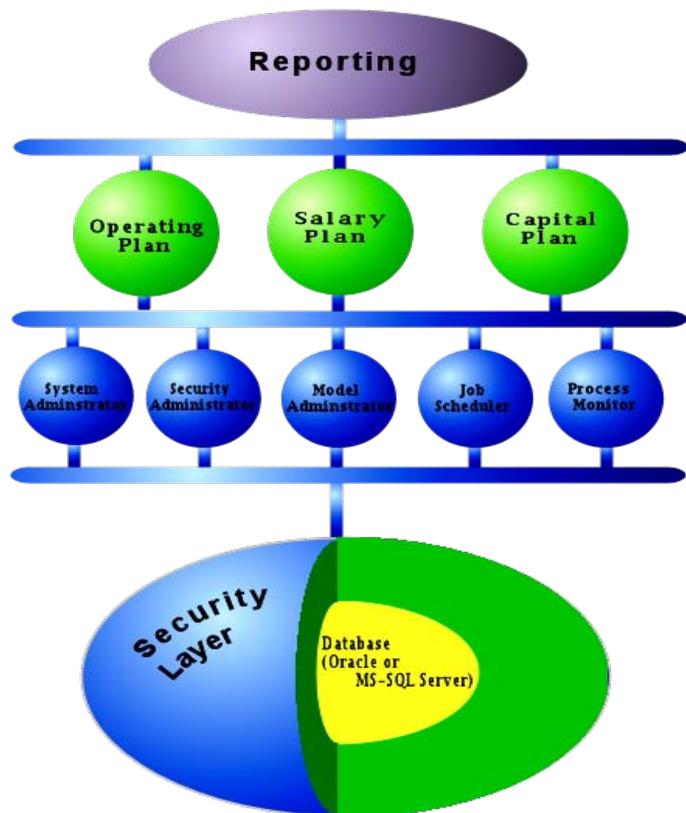

High performance budgeting, planning and reporting.

Demands by stakeholders in recent years for increased accountability have meant that financial management processes such as budgeting, planning and financial reporting in most medium-sized and large organizations have needed to undergo significant changes. For example, many local governments now require detailed multi-year plans, instead of the traditional single-year budget. FMW Web is a comprehensive suite of budgeting, planning and reporting software modules that allows organizations to adapt quickly and efficiently to this new and demanding environment.
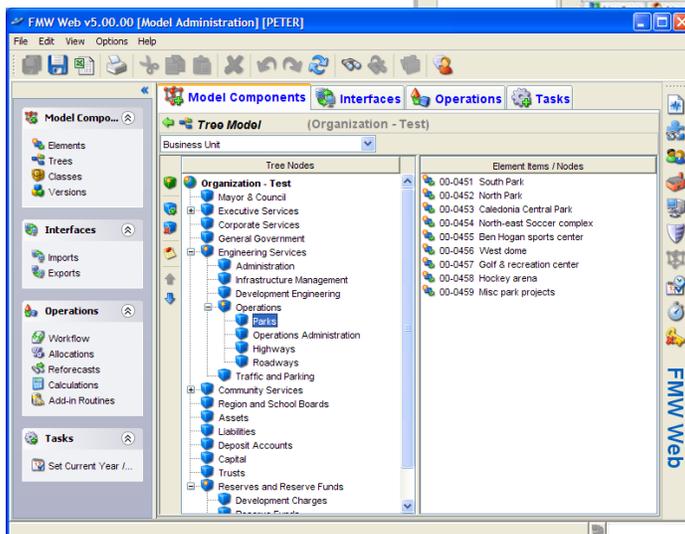

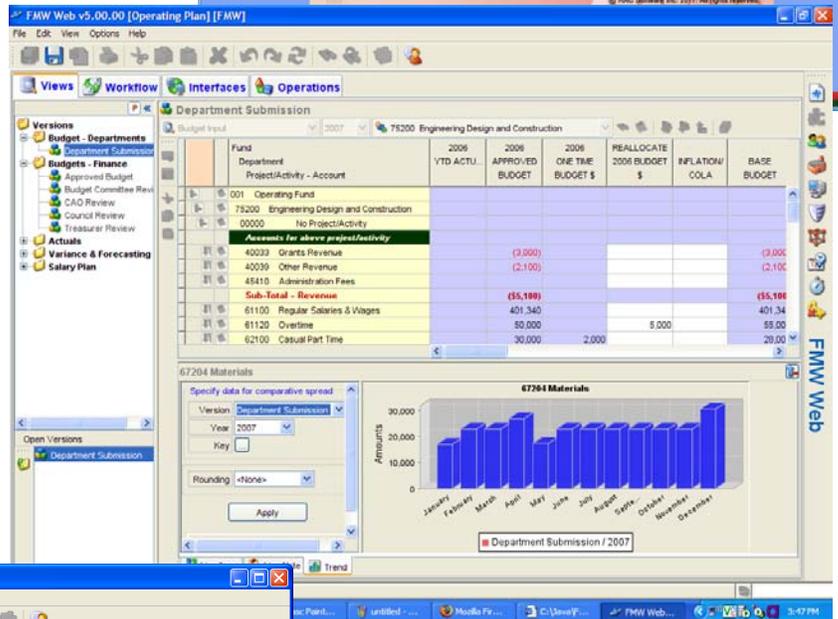

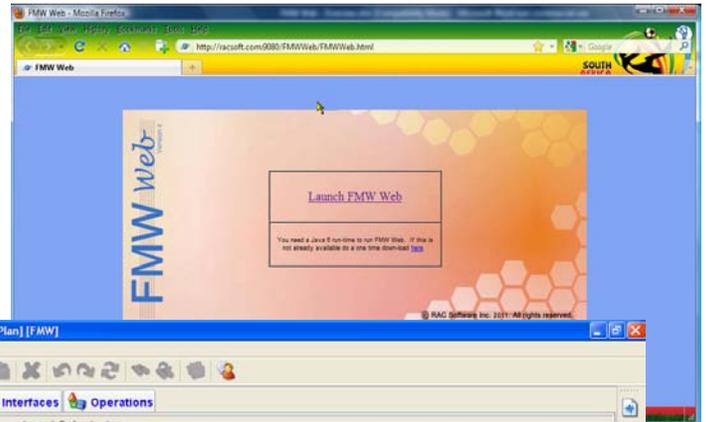

Introducing FMW Web

FMW Web is a comprehensive, integrated set of software modules which can be configured to meet the requirements of even the most demanding budgeting, planning and reporting processes. It combines a rich user interface for a superior end-user experience, while at the same time its fully web-based architecture delivers a high degree of scalability, security and flexibility.

OVERVIEW

Key Features

- Highly flexible and configurable data model.

- Unlimited number of data structures, versions and reporting trees.

- Sophisticated role-based security system.

- Open interfaces, including table-to-table, flat files and XML, allowing easy integration with a variety of source systems.

- Configurable editing templates, including flexible sub-totaling and formatting, presenting end-users with a highly attractive and productive interface.

- Extensive modeling tools including allocations, re-forecasts, and modeling data on historic patterns.

- A comprehensive end-user reporting tool, which allows the production of presentation quality reports, including both numeric and textual information as well as a variety of charts.

- Multi-level workflow system, including a highly graphical control panel and selective promotions and demotions, giving budget administrators comprehensive control over the budgeting process.

- Job scheduling system, allowing the full automation of a variety of processes including interfaces, reporting and modeling operations.
